

Midwestern Grazer Mix

FEATURES

- Intended for use with managed intensive grazing practices
- Mix of highly palatable grasses and legumes
- Produces high-quality forage for making milk, meat, or hay mix
- Diverse formula for season long grazing crop

FORMULATION

- 35% Tekapo Orchardgrass coated
- 15% Profit Orchardgrass coated
- 15% Preval Meadow Fescue
- 15% Power Tetraploid Per Ryegrass
- 10% MacBeth or Fleet Meadow Brome
- 7% Gallant Red Clover
- 3% Kopu II White Clover

PLANTING & SEEDING INFO

- Plant March–April, or Mid Aug–Sept
- Seed at 30–40 lbs/A

ESTABLISHING A PERFECT PASTURE

A perfect pasture begins with good soil preparation. The first step is to obtain an accurate soil sample, and improve your soil conditions accordingly. Check with your local extension service for assistance. Using a starter fertilizer is helpful for getting a uniform stand. The next step is to prepare a proper seedbed. If possible, use a Brillion-type seeder. When renovating a pasture, use a no-till drill to sow the seed, and if needed, use a non-selective herbicide to reduce competition. Ideal seeding depth is 1/4"-3/8" deep. Adequate soil-to-seed contact can be ensured by rolling/packing the soil. Finally, all seed needs moisture to become well established. Irrigate if necessary, and plant during the spring or late summer. Frost seeding can be accomplished with some mixes/species by broadcasting seed during the late winter months. Allow plants to be well established before heavy grazing or set stocking. Allow the plants to grow to 8-12" before clipping or lightly grazing down to 3-4" tall. Utilize grazing and clipping to help control weeds. Use chemicals for weed control if necessary. Always follow label directions.

Sow within the recommended planting times for best results
